The Barracuda is a versatile, self fill, EOD tool; designed for ease of use and reliability. Initially designed for underwater use, the Barracuda has a built-in waterproof stand-off, allowing charges to be deployed at depths of up to 300m. Light-weight construction and simple deployment also make the Barracuda well suited for use above the surface.

The system has a number of unique features which improve the performance and reliability while easing filling and deployment. The explosives closure assembly ensures that, as it is screwed into position, the explosive fill is pressed into intimate contact with the liner while securely locking the detonator in the optimum position. The detonator support is designed to accommodate two detonators for use with dual path initiation systems, providing extra reliability when it is most needed.

The Barracuda 88 can reliably penetrate 280mm of EN8 steel.
