The Weever is a versatile, self fill, EOD tool designed for ease of use and reliability. The device can be loaded with several different natures including conventional conical, EFP and incendiary liners as well as water. The range of natures available grant the system the versatility to remove fuses, deflagrate or detonate explosive fills, gain access through bomb casings and disrupt IEDs.

The system has a number of unique features which improve the performance and reliability while easing filling and deployment.

The clear casing makes consistent explosive filling easy. The explosives closure assembly ensures that, as it is screwed into position, the explosive fill is pressed into intimate contact with the liner while securely locking the detonator in the optimum position. An optional tripod leg mounting attachment is also available.

Performance

The EFP reliably penetrates 25mm of EN8 steel at a stand-off distance over 300mm.

The conical liner reliably penetrates 65mm of EN8 steel using the inbuilt stand off.
